

Sample Questions

Question 2 [25 marks]

Suppose we ran a survey to investigate the average time university students use their phones per week. We randomly selected 75 participants and collected the average hours they spent using phones per week in a month. The distribution of the average phone using hours per week is right skewed. The mean and standard deviation of the average phone time per week are $\bar{x} = 17.4$ hours and $s = 8.2$ hours, respectively.

a) What type of distribution does the sampling distribution of the average phone-using hours per week follow, if the sample size of the survey is considered large enough? (2 marks)

b) What will be the mean and standard deviation of the sampling distribution of the average phone-using hours per week? (8 marks)

c) What is the probability that the average phone-using hours is larger than 20 hours per week? You can refer to the z-table in the **Appendix** at the end of this paper. (10 marks)

d) Fill in the blanks in the following code snippet to generate the sampling distribution of the sample mean of phone-using hours and show the sampling distribution in a histogram. Suppose the average phone using hours we collected are stored in the column "Phone Time" in the pandas dataframe `phone_time_df`, and we will resample the original sample **10,000** times.

Please fill in the blanks of the code snippet in the solution box.

(5 marks)

```
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns

# Repeat sampling from the original sample for 10,000 times
phone_time_means = np.array([phone_time_df[_____].sample(frac=____,
                                                             replace=____).mean()
                             for i in range(____)])

# Plot a histogram to visualise the sampling distribution
fig, ax = plt.subplots(figsize=(4, 3))
sns.histplot(data=_____)
```

Answer

a)

Normal distribution	[2 marks]
TOTAL	[2 marks]

b)

<p>the mean of the sampling distribution will be around the mean of the original sample (2 marks), which is 17.4 hours (2 marks)</p> <p>the standard deviation of the sampling distribution (standard error of the mean) will be</p> $SE \approx \frac{s}{\sqrt{n}} \quad (2 \text{ marks})$ $= \frac{8.2}{\sqrt{75}} = 0.95 \quad (2 \text{ marks})$	[8 marks]
TOTAL	[8 marks]

c)

<p>Since the mean of the sampling distribution of the average phone using hours per week $X \sim N(17.4, 0.95^2)$</p> $P(X > 20) \quad (1 \text{ mark})$ $= P\left(\frac{X - 17.4}{0.95} > \frac{20 - 17.4}{0.95}\right) \quad (2 \text{ marks})$ $= P(Z > 2.74) \quad (2 \text{ marks})$ $= 1 - P(Z < 2.74) \quad (2 \text{ marks})$ <p>By looking up the z-table</p> $P(Z < 2.74) = 0.99693 \quad (2 \text{ marks})$ <p>So</p> $P(X > 20) = 1 - 0.99693$ $= 0.00307 \quad (1 \text{ mark})$	[10 marks]
TOTAL	[10 marks]

d)

<pre>import numpy as np import matplotlib.pyplot as plt import seaborn as sns # Repeat sampling from the original sample for 10,000 times phone_time_means = np.array([phone_time_df['Phone Time'].sample(frac=1, replace=True).mean() for i in range(10000)]) # Plot a histogram to visualise the sampling distribution fig, ax = plt.subplots(figsize=(4, 3)) sns.histplot(data=phone_time_means) plt.show()</pre> <p>(1 mark for each blank)</p>	[5 marks]
TOTAL	[5 marks]
